CODESTORM HACKATHON · SPEAKING SCRIPT

SEED X: what Tejash and Shaurya say

A 6–7 minute pitch that follows the 11-slide deck: problem → our answer → why it's better → why every farmer can use it → why you can trust it → live proof → business. Every number here is either sourced, from our live app, or clearly called an example.

The one sentence to remember

"SEED X helps a farmer see his real buyers, his real costs and his real take-home, before he says yes."

Split

TEJASH slides 1–8 (story, solution, ClusterCart, NetBack, farmers)

SHAURYA slides 9–10 (trust, tech, positioning)

BOTH slide 11 (demo, business, close)

Timing plan (about 6½ minutes + Q&A)

Slide	Speaker	Time	Job of the slide
1 Hook	Tejash	0:25	Make them feel the loss
2 Value gap	Tejash	0:35	The shocking number
3 Coordination	Tejash	0:30	The real root cause
4 Solution	Tejash	0:35	One workflow, software only
5 ClusterCart	Tejash	0:45	The wow: it knows when NOT to pool
6 NetBack	Tejash	0:35	Higher price ≠ better deal
7 Workspace	Tejash	0:20	It's a daily business tool
8 Inclusion	Tejash	0:35	Every farmer can use it
9 Security	Shaurya	0:40	Proof, not promises
10 Ecosystem + tech	Shaurya	0:30	Why we're different, honestly
11 Demo + business	Both	1:15	Show it working, ask for the win

Delivery rules

- Look at the judges, not the slide. The slide is your backup, you are the story.
- Pause for one full second after every big number (33%, "it said no", ₹2,250).
- Say "can help" and "estimated", never "guaranteed". Judges trust teams that are honest about limits.
- Hand-offs are short and warm: "Shaurya will show you why you can trust it."
- If the internet dies, don't apologise for long: "We planned for this," and play the backup video.

TEJASH Slides 1–4

1 · Hook — 0:25

DO Walk to centre. Don't touch the clicker for 3 seconds. Look at the judges.

SAY Imagine a farmer in Sehore. He grows good tomatoes. He works for months. And on the day he sells, most of that value disappears before the tomatoes ever reach your kitchen.

SAY We're Tejash and Shaurya, and we built **SEED X**, because a farmer's harvest should not lose value before it reaches the buyer.

2 · The value gap is real — 0:35

SAY This isn't a feeling. The Reserve Bank of India studied it. When you pay one rupee for tomatoes, the farmer is estimated to get about **33 paise**. Onions, about 36. Potatoes, about 37.

Pause. Then: "Roughly two-thirds of what we pay never reaches the person who grew it."

SAY It goes through traders, transport, storage and retail. Every hand-off adds cost. That's exactly the problem in today's challenge.

DO Point to the chain on the right as you name each step.

3 · It's a coordination problem — 0:30

SAY Why does this keep happening? Not because farmers can't sell. It's because nobody **coordinates**.

SAY The farmer can't see enough buyers. The hostel or restaurant can't find small local lots. Three nearby farms send three separate small trips. And every day tomatoes wait, they lose value.

"Middlemen exist because they coordinate. So we asked: what if software did the coordination, and the farmer kept the value?"

4 · One software workflow — 0:35

SAY So SEED X is one simple flow. The farmer lists his harvest. Buyers post what they need. SEED X checks the crop, grade, quantity, location and timing. Then two things make it special: **ClusterCart**, which decides how to deliver, and **NetBack**, which shows what the farmer really takes home. And every order is tracked till delivery.

SAY It's completely software. No new hardware, no machines to install. A farmer only needs the phone he already has.

TEJASH Slides 5–8

5 · ClusterCart: the wow 0:45

SAY Here's our special feature. Three farms have 80, 60 and 100 kilos. Three buyers need 70, 90 and 80. Can one truck do the job instead of six trips? ClusterCart checks crop, grade, quantity, distance, freshness, time windows and transport cost. Then it decides.

SAY Now the part we're proudest of. We ran it on our live app. And it said **no**.

Pause. "Pooling would have cost 18.7% more, so it recommended separate trips, and explained exactly why."

SAY Most apps always tell you to use their feature. Ours tells the truth, even when the answer is "don't pool". That's why farmers and buyers can trust its "yes".

DO Point at the green "Live run" box.

6 · NetBack 0:35

SAY Second question every farmer asks: "How much do I actually take home?" A ₹2,500 offer sounds good. But if the farmer pays ₹200 transport and ₹50 packing, he really gets **₹2,250**.

"A higher offer is not always a better deal. NetBack shows the real one."

SAY And the buyer sees his own number, the landed cost, separately. Both sides compare honestly. That's how better prices for farmers and fairer prices for buyers can both happen.

7 · Daily business workspace 0:20

SAY And it isn't a one-time listing site. It's the farmer's daily office: his stock, his offers, his orders, his clients. SEED X remembers who bought from him, so a one-time buyer becomes a repeat client. That's real, long-term income.

8 · Built for every farmer 0:35

SAY A solution is useless if a farmer can't use it. SEED X works in **ten Indian languages**, in their own scripts: Hindi, Bengali, Telugu, Marathi, Tamil, Gujarati, Kannada, Malayalam, Punjabi and English.

SAY Big buttons, short steps, clear kilos and quintals, and it runs on low data. 98% of Indian internet users already use Indian-language content, so this is how India goes online.

SAY And for farmers who aren't comfortable yet, our rollout plan is assisted onboarding through farmer groups and cooperatives.

DO Optional, if natural for you: say one line in Hindi: "Kisan apni bhasha mein, apne phone par, apna sahi daam dekh sakta hai."

SAY Now, money and trust go together. Shaurya will show you why you can trust it.

SHAURYA Slides 9–10

9 · Trust is built into the transaction 0:40

SAY Thanks, Tejash. When money and a farmer's harvest are involved, "trust us" is not enough. So we didn't put a shield icon here. We put **proof**.

SAY Every one of our 40 database tables has row-level security: a user can only see their own private data. Admin actions need two-factor login. Secret keys never touch the browser.

"We tried to break it ourselves. Farmer B trying to read Farmer A's private notes: denied. Two buyers grabbing the last stock at the same second: exactly one wins. The same order sent twice: no duplicate."

SAY That's 141 database security tests, all passing, plus 14 browser tests including accessibility. We don't call it unhackable. We show you what's tested.

10 · Complement the ecosystem 0:30

SAY We also want to be honest. India already has e-NAM for electronic mandi trading, and AGMARKNET for daily mandi prices. We're not replacing them.

SAY SEED X focuses on what happens **around** the farmer every day: his stock, local buyers, pooled delivery, his real net, his clients. It's a local workflow that can use public price data as a benchmark.

SAY Technically: React and TypeScript on the front, Supabase Postgres with security rules on the back, hosted on Cloudflare and deployed automatically from GitHub. It's live right now. Let us show you.

BOTH Slide 11 · Demo, business, close (1:15)

Live demo (≈ 50 s): Shaurya drives, Tejash narrates 0:50

Shaurya clicks	Tejash says
Marketplace → Fresh hybrid tomatoes	"Here's a real tomato listing from our demo farmer: 900 kilos, grade A."
Type 300 kg, ₹22, "Seller pays transport"	"As a buyer offers, NetBack instantly shows the farmer's real take-home and the buyer's landed cost."
ClusterCart → wheat requirement → Run	"ClusterCart checks every listing… and look, it explains why pooling isn't worth it here."
Dashboard → switch language to Hindi	"And the farmer sees all of this in his own language."

DO Backup: if the site is slow or the internet fails, play SEED_X_Demo_Backup.mp4 (79 s) straight away. Say: "We recorded this from the live app this morning."

Business + close 0:25

SAY **SHAURYA** How does it sustain itself? Farmers list for free. Buyers pay a small fee on completed orders, and institutional buyers like hostels and canteens can pay for ClusterCart planning. We'll start with a pilot: one district, one crop cluster, with a farmer producer group. And we'll measure farmer take-home per kilo, buyer cost per kilo, and repeat buyers.

SAY **TEJASH** Farmers don't need sympathy. They need visibility: of buyers, of costs, of their real price.

"SEED X helps shorten the distance between a farmer's harvest and a fairer market opportunity. Thank you."

DO Both stand still and smile for 2 seconds. Then: "We're happy to take questions."

Judge Q&A: likely questions and strong answers

"How is this different from e-NAM?"

e-NAM connects APMC mandis for electronic trading and auctions. SEED X sits around the farmer's daily work: direct local buyers like hostels and restaurants, pooled delivery decisions, net take-home and repeat clients. It can use public mandi prices as a benchmark. We complement it.

"Will farmers really use an app?"

That's why it's mobile-first, in ten Indian languages, with short steps and low data. Our rollout is assisted onboarding through farmer producer groups. We'll measure task completion with real farmers in the pilot; we're not assuming it.

"Is ClusterCart AI?"

No, and that's deliberate. It's rule-based and explainable: hard checks first, then a cost comparison. A farmer or buyer can see exactly why it said yes or no. Transport costs are estimates, and we label them that way.

"How much will farmers earn more?"

We won't promise a number we haven't measured. NetBack makes the real take-home visible, and ClusterCart cuts avoidable transport when pooling is actually cheaper. In the pilot we'll measure net proceeds per kilo against the farmer's current option.

"Is the data real?"

The app and database are live. The listings in the demo are clearly labelled demo data. Mandi prices are marked sample until we connect the government data.gov.in feed, which needs an API key.

"What about payments?"

Not built yet, on purpose. We don't want to fake payment status. Orders say payment is settled directly between the parties; a verified payment gateway is on the roadmap.

"What if two buyers accept the same stock?"

SHAURYA The database reserves stock in one locked step. We tested two simultaneous acceptances: exactly one wins and nothing is oversold. Retrying the same request returns the same order, not a duplicate.

"How do you make money?"

Free for farmers to list. A small fee on completed orders paid by buyers, and ClusterCart planning for institutional buyers. It's a proposed model we'll validate in the pilot.

"Who did what?"

TEJASH Founder and product lead: the problem, the farmer flow, ClusterCart and NetBack design.
SHAURYA Co-developer and technical collaborator: architecture, security and testing. Both of us built and understand the whole system.

"What's next?"

Live government price data, native-speaker review of all ten languages, a payment partner, SMS alerts, and a one-district pilot with a farmer group.

Words to avoid

"Guaranteed", "first in India", "only platform", "100% secure", "AI-powered" (ClusterCart is rule-based), "real users" or "farmers are using it" (we only have demo accounts so far), any savings figure not on the slides.
